

CYCLOKETONES AS PRECURSOR FOR CONVENIENT SYNTHESIS OF AZOLOPYRIMIDINES AND 5-ARYLAZOTHIAZOLES

Sayed A. Ahmed^a, Nadia A. Abdelriheem^b and Abdou O. Abdelhamid^{b*}

Keywords: hydrazoneoyl halides; aminopyrazoles; pyrazolo[1,5-*a*]pyrimidines; pyrazolo[1,5-*a*]quinazolines; imidazo[1,2-*a*]cycloalka[*e*]pyrimidine; hydrazine-carbothioamide; arylazothiazoles

Condensation of sodium (3-oxocycloalkylidene)methenolate with several heterocyclic amines afforded pyrazolo[1,5-*a*]pyrimidine and pyrazolo[1,5-*a*]quinazoline derivatives. Also, 2-(2-cycloalkylidenehydrazinyl)-4-substituted-5-(phenyldiazaryl)-thiazole derivatives were synthesized via reaction of hydrazoneoyl halides with 2-cycloalkylidene-hydrazinecarbothioamide. Structures of the newly synthesized compounds were elucidated by elemental analysis, spectral data, alternative synthetic routes and chemical transformation whenever possible.

reaction seems to occur *via* the initial formation of the intermediate **5** followed by dehydration cyclization to give of the **6a** as end product (Scheme 1).

Scheme 1: Synthesis of pyrazol[1,5-*a*]pyrimidines (6-8)a-e

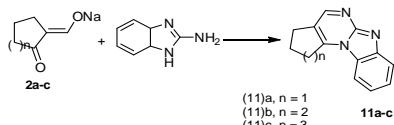

Results and discussion

Treatment of 3-amino-5-phenyl-1*H*-pyrazole (**3a**) with sodium (2-oxocyclopentylidene)methenolate [27] (**2a**) in acetic acid containing piperidinium acetate afforded a product that may be 2-phenyl-7,8-dihydro-6*H*-cyclopenta[*e*]pyrazolo[1,5-*a*]pyrimidine (**6a**) or isomeric 2-phenyl-6,7-dihydro-5*H*-cyclopenta[*d*]pyrazolo[1,5-*a*]pyrimidine (**10a**) (Scheme 1). The structure **6a** was confirmed by elemental analysis, spectral data. IR (cm⁻¹) spectrum of the product revealed bands at 3085 (CH, aromatic), 2986 (CH, aliphatic), 1615 (C=N), 1597 (C=C). Its ¹H NMR spectrum showed signals at δ = 2.57 (m, 2H, CH₂), 2.87-2.92 (m, 4H, 2CH₂), 6.51 (s, 1H, pyrazole H-4), 7.34-7.89 (m, 5H, ArH's), 8.23 (s, 1H, pyrimidine H-4). The

The suggestion of the formation of the alternative isomeric product **9** is based on the initial attack of the pyrazole NH group at the formyl group **4a**. This suggestion is excluded due to the higher nucleophilicity of the exocyclic primary amino group than the endocyclic NH group. Similarly, treatment of the appropriate **3b-e** were reacted with each of **2a-c** to give the tetrahydrocyclopenta-**5b-e**, tetrahydrocyclohexa-**6a-e**, and tetrahydrocycloheptapyrazolo[1,5-*a*]pyrimidine derivatives **7a-e**, respectively.

Analogously, the reaction of 2-aminobenzimidazole with each of **2a-c** in piperidinium acetate gave 2,3-dihydro-1*H*-benzo[4,5]imidazo[1,2-*a*]cyclopenta[*e*]pyrimidine (**11a**),

1,2,3,4-tetrahydrobenzo[4,5]imidazo[1,2-*a*]quinazoline (**11b**) and 2,3,4,5-tetrahydro-1*H*-benzo[4,5]imidazo[1,2-*a*]cyclohepta[e]pyrimidine (**11c**), respectively (Scheme 2).

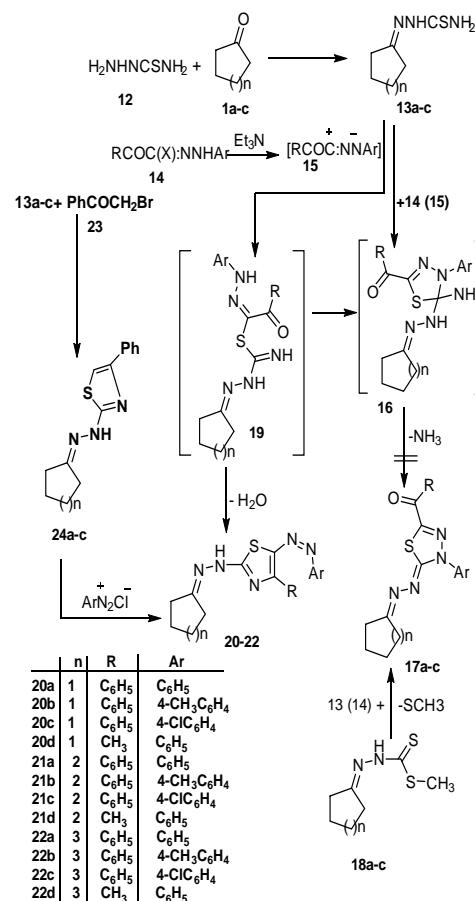

Scheme 2. Imidazo[1,2-*a*]cyclopenta[e]pyrimidine **11a**, imidazo[1,2-*a*]quinazoline **11b** and imidazo[1,2-*a*]cyclohepta[e]pyrimidine **11c**.

Next, we studied the reactions of hydrazonoyl halides with 2-cycloalkylidene-hydrazinecarbothioamide [28] **13a-c**. Thus, reaction of compound **13a** reacted with 2-oxo-*N'*, 2-diphenylacetohydrazonoyl bromide (**14a**) in ethanol in presence of catalytically amount of triethylamine gave one isolable product evidenced by *tlc* that proved to be 2-(2-cyclopentylidenehydrazinyl)-4-phenyl-5-(phenyldiazenyl)-thiazole (**20a**) (Scheme 3). Structure of **20a** was confirmed by elemental analysis, spectral data and alternative synthesis. For example, IR spectrum its exhibit revealed band at 3320 (NH), it show no of any CO group. ¹H NMR showed signals at δ 1.56-1.60 (m, 4H, 2CH₂), 2.13-2.25 (m, 4H, 2CH₂), 7.33-7.98 (m, 10H, ArH's) and 9.08 (s, br., 1H, NH). Moreover, **24a** [29], which was prepared via reaction of ω -bromoacetophenone (**23**) with **13a** in ethanol, was reacted with benzendiazonium chloride in ethanolic sodium acetate at 0 °C afforded product identical in all aspect (mp., mixed mp. and spectra) with **20a** (Scheme 3).

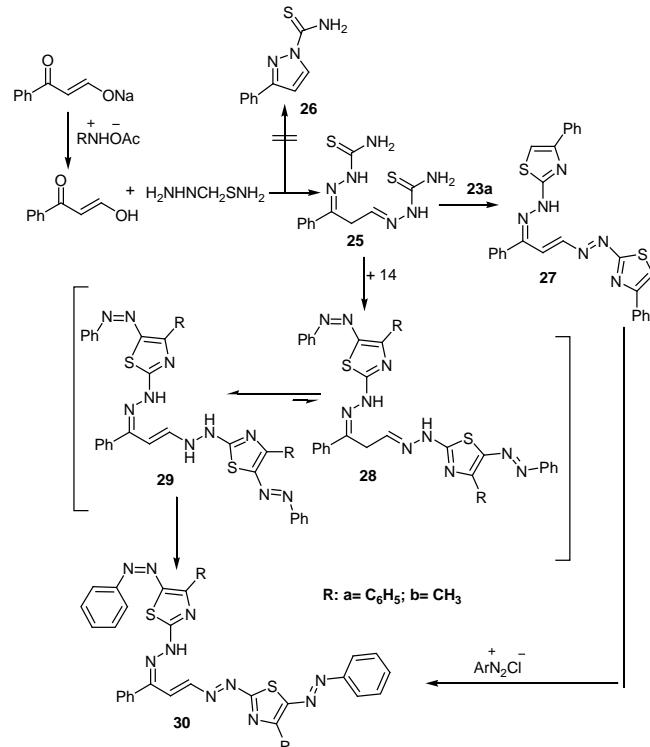

Two possible pathways can account for the formation **20a** via 1,3-addition of the thiol tautomer of **13** to the nitriliimine **15**, (generated *in situ* from hydrazonoyl halide **14a** and triethylamine), to form the thiohydrazonate ester **19a**, which undergoes dehydrative cyclization to yield **20a**. The formations of **19** and **20** are similar to the reaction of hydrazonoyl chloride with 1-phenyl-1,4-dihydrotetrazole-5-thione [30] and 5-phenyl-1,3,4-thiadiazole-2(3*H*)-thione [31] or 1,3-cycloaddition of nitriliimine **15** to C=S double bond of **13a** can give directly **16**. The latter intermediate **16** was converted to **17a**, by loss one molecule of ammonia (Scheme 3). The latter pathway was ruled out on the base of IR, ¹H NMR and alternative synthetic route.³²

Similarly, the appropriate **13a-c** reacted with each of hydrazonoyl halides **14a,b** and ω -bromoacetophenone in ethanol gave (**20-22**a-d and **24a-c**) (Scheme 3).

Finally, reaction of sodium 3-oxo-3-phenylprop-1-en-1-olate was reacted with thiosemicarbazide (**12**) in acetic acid containing piperidinium acetate afforded 2,2'-(1-phenylpropane-1,3-diylidene)bis(hydrazinecarbothioamide) (**25**) and not 3-phenyl-1*H*-pyrazole-1-carbothioamide (**26**) according to mp. and reaction of benzoylacetaldehyde with thiosemicarbazide [33]. Treatment of compound **25** was reacted with the appropriate hydrazonoyl halides afforded 4-phenyl-2-(1-phenyl-3-(4-phenyl-5-(phenyldiazenyl)thiazol-2-yl)diazenyl)allylidene)-hydrazinyl)-5-(phenyldiazenyl)-thiazole (**30a**) (Scheme 4).

Scheme 3: 2-(2-Cycloalkylidenehydrazinyl)-4,5-disubstituted thiazoles (20-22)a-d

Scheme 4: Synthesis of thiazoles **30a** and **30b**

Structure of **30a** was confirmed by elemental analysis, spectral data and alternative synthetic route. Thus, treatment of 4-phenyl-2-(2-(1-phenyl-3-(4-phenyl-5-phenylthiazol-2-yl)diazenyl)allylidene)hydrazin-yl)thiazole (**27a**), which obtained by reaction of **25** with ω -bromoacetophenone, with benzenediazonium chloride ethanolic sodium acetate solution at 0–5 °C afforded product identical in all aspect (mp., mixed mp. and spectra) with **30a**.

Experimental

All melting points were determined on an electrothermal apparatus and are uncorrected. IR spectra were recorded (KBr discs) on a Shimadzu FT-IR 8201 PC spectrophotometer. NMR spectra were recorded in CDCl_3 and $(\text{CD}_3)_2\text{SO}$ solutions on a JNM-LA 400 FT-NMR system and a Varian Gemini 300 MHz spectrometer and chemical shifts are expressed in δ ppm units using TMS as an internal reference. Mass spectra were recorded on a GC-MS QP1000 EX Shimadzu. Elemental analyses were carried out at the Microanalytical Center of Cairo University. Sodium (2-oxocycloalkylidine)methenolate [27] (**2a-c**), 2-cycloalklidenehydrazinecarbothioamide [28] **13a-c**, and hydrazoneoyl halides [34,35] **14**, methyl 2-cyclopentylidenehydrazine-1-carbodithioate (**18**) [36] were synthesized as previously reported.

Synthesis of pyrazolo[1,5-a]pyrimidines (**6-8a-e**, benzo[4,5]imidazo[1,2-a]cyclopenta[e]pyrimidine **11a**, benzo[4,5]imidazo[1,2-a]quinazoline **11b** and benzo[4,5]imidazo[1,2-a]cyclohepta[e]pyrimidine **11c**.)

A solution of sodium salt of (2-oxocycloalkylidine)methanolates **2a-c** (0.01 mol), aminopyrazoles, 2-aminobenzimidazole (0.01 mol) and piperidine acetate (1 ml) in H_2O (3 ml) was refluxed for 15 minutes. Acetic acid (1.5 ml) was added to the hot solution. The solid product was filtered off and recrystallized from ethanol to give (**5-7a-e**, **11a**, **11b** and **11c**).

Synthesis of 5-arylhiazole derivatives (20-22)a-d

Method A: A mixture of thiosemicarbazide **13a-c** (5 mmol) and the appropriate hydrazoneoyl halides **14a-c** (5 mmol) in ethanol (20 mL) containing triethylamine (5 mmol, 0.75 mL) was refluxed for 4h, allowed to cool and the solid formed was filtered off, dried and recrystallized from acetic acid to give (**20-22a-d**).

Method B: To a appropriate of **24a-c** (5 mmol) in ethanol (30 mL) was added sodium acetate trihydrate (1.3 g, 5 mmol), and the mixture was cooled to 0-5 °C in an ice bath. To the resulting cold solution was added portionwise a cold solution of arenediazonium chloride [prepared by diazotizing the appropriate of aniline, 4-methylaniline, 4-chloroaniline (5 mmol) dissolved in hydrochloric acid (6 M, 3 mL) with a solution of sodium nitrite (0.35 g, 5 mmol) in water (3 mL)]. After complete addition of the diazonium chloride, the reaction mixture was stirred for a further 30 min in an ice bath. The solid that separated was filtered off, washed with water and finally recrystallized from ethanol to give proved to be identical in all aspects (mp, mixed mp and spectra) with compound (**20-22a-d**) which obtained from method A.

2-(2-Cyclopentylidenehydrazinyl)-4-phenyl-5-(phenyldiazenyl)thiazole (20a)

Conclusion

In conclusion, compounds of type 2 proved to be useful precursors for synthesis of various fused pyrimidines via their reactions with heterocyclic amines. Also, 2 reacted with thiosemicarbazones then with hydronoyl halides gave thiazole derivatives in good yields. The structures of the newly synthesized compounds were confirmed by spectral data and elemental analyses.
